Cellular Localization Cytoplasm

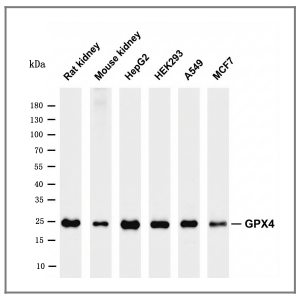

Tissue specificity Present primarily in testis. Expressed in platelets (at protein level) (PubMed:11115402).

Function Catalytic activity:2 glutathione + a lipid hydroperoxide = glutathione disulfide + lipid + 2 H(2)O.,Disease:Defects in GPX4 may be a cause of infertility.,Function:Protects cells against membrane lipid peroxidation and cell death. Required for normal sperm development and male fertility. Could play a major role in protecting mammals from the toxicity of ingested lipid hydroperoxides. Essential for embryonic development. Protects from radiation and oxidative damage.,similarity:Belongs to the glutathione peroxidase family.,subunit:Monomer. Has a tendency to form higher mass oligomers.,tissue specificity:Present primarily in testis.,

•Validation Data

Western blot analysis was performed using MDA-MB-231 cell lysates; proteins were separated by 4–20% SDS-PAGE, with the primary antibody applied at a dilution of 1:5000.

Western blot analysis was performed on lysates prepared from Rat kidney, Mouse kidney, and human cell lines including HepG2, HEK293, A549, and MCF7. Proteins were resolved by 4–20% gradient SDS-PAGE, and the expression of GPX4 was subsequently detected.
